

Dear Florian,

Thank you for the June 30, 2026 JPE reproducibility report for manuscript 20250778, “Carbon prices, forest conservation and reforestation in the Brazilian Amazon.” We have revised the replication materials and manuscript in response to the issues raised in the report. The revised manuscript is attached separately and is also included in the zipped resubmission package.

This resubmission contains four sets of changes. First, we addressed the documentation issues raised in the report through an expanded and reorganized `README.md`. Second, to address the report’s data-citation request, we added a dedicated data-citation section to the manuscript. Third, to address the report’s comments on in-text numbers, we added code and manuscript documentation so that the relevant numbers can be replicated and audited directly. Fourth, during our own review of the replication materials, we identified and corrected a discounting inconsistency in the code. The repository now regenerates the current results reported in the revised paper, including the table entries affected by that correction.

## 1. **README updates in response to the reproducibility report.**

We revised `README.md` to address the documentation feedback in the report. The updated README incorporates the contents of `data/codebook.csv`, making the README the central source for the data inventory, access notes, generated-data descriptions, open-format companions, source permissions, and main calibration variables. We also expanded the local and Slurm computational-environment documentation, including the author-tested Mac configuration, Python, R, Gurobi, and CmdStan versions, requested Slurm resources, module setup, grouping behavior, runtime, memory, storage, log, dry-run, workflow, rights, and license information.

We further added Linux setup guidance based on the reproducibility team’s experience, including notes on the system support libraries and fixes needed to restore the package on Linux. Finally, we added an up-front “Journal Reproducibility Check Status” table and an “Output Manifest: Tables and Figures” section mapping exhibits to the scripts and line numbers that generate them. In connection with the exhibit feedback, we also corrected the Figure 11 y-axis formatting issue noted in the report, so the manuscript figure and replication output now use consistent axis scaling.

## 2. **Data citations in the manuscript.**

To address the report’s request that data sources be cited in the paper, we added a dedicated “Data sources and data citations” subsection to Appendix A.1 of the revised manuscript. This subsection gives dataset-level citations, source URLs or DOIs where available, uses in the analysis, and package locations for all external data sources used in the paper. These include World Bank/WDI, the World Bank Carbon Pricing Dashboard, Climate Watch/WRI, Amazonia 2030, MapBiomass, ANA/PNRH basin layers, ESA Biomass CCI, SEEG, IBGE, SEAB-PR/DERAL through IPEA, IPEA, WorldClim, and FGV IBRE. The README continues to document the corresponding package locations, access conditions, and redistribution notes.

### 3. Replication of in-text numbers.

To address the report’s comments on in-text numbers not tied to tables or figures, we added replication code and README documentation for the relevant items. The README now identifies each such number or claim and points to the corresponding replication evidence in generated outputs and logs. We also updated selected replication and post-processing code so that these values can be regenerated or verified directly from the package.

In the revised manuscript, we updated the number in footnote 39. We also added supporting material in Appendix A.7, including explanatory text and a figure comparing the relevant trajectories under alternative discount-rate specifications. These additions provide both a code-level and manuscript-level audit trail for the in-text claims identified in the report.

### 4. Discounting correction and updated table outputs.

In addition to the issues raised in the report, our internal review identified a discounting inconsistency in the code used to produce some table entries. We corrected the inconsistency, regenerated the affected outputs, and updated the corresponding tables in the revised manuscript. The resubmitted repository is synchronized with the revised manuscript and now reproduces the latest results reported in the paper, including the tables affected by this correction.

We believe that the revised README, the new manuscript data-citation section, the code and manuscript updates supporting replication of the in-text numbers, and the discounting correction address the reproducibility issues raised in the report and improve the auditability of the replication package. We are grateful to you and the reproducibility team for the careful review and helpful guidance.

Sincerely,

Juliano Assunção
